

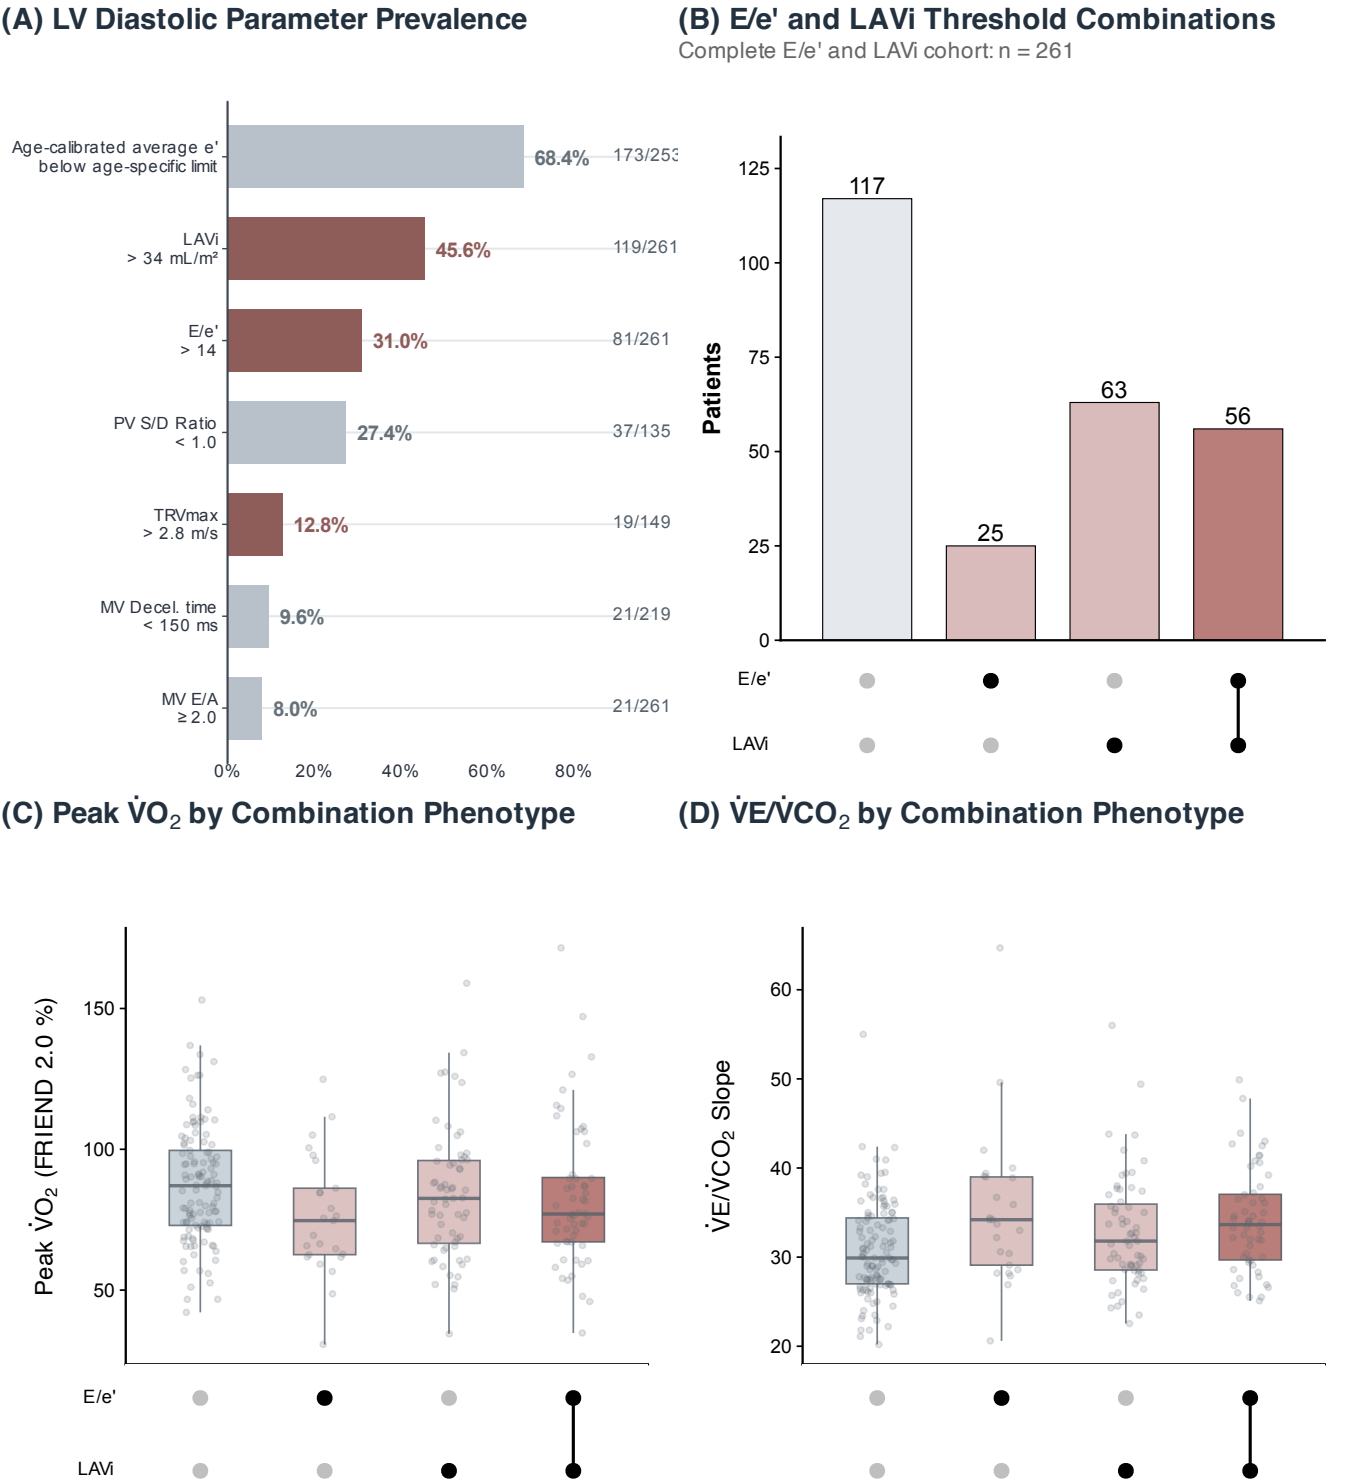

Figure 2. Baseline HCM LV Diastolic Parameters and Cardiopulmonary Performance. Complete E/e' and LAVi were required (n=261); TRVmax was available in 149. This figure displays combinations of E/e' and LAVi threshold crossings and therefore requires both parameters; the cross-sectional models analyse each parameter in its own available-case sample. **(A)** Parameter prevalence using observed denominators. **(B)** Combinations of E/e' and LAVi threshold crossings. **(C)** Peak $\dot{V}O_2$ (FRIEND 2.0 % predicted) stratified by combinatorial filling-pressure phenotype, with Kruskal-Wallis P value. **(D)** $\dot{V}E/\dot{V}CO_2$ slope stratified by the same combinatorial phenotype, with Kruskal-Wallis P value.
