

Supplemental Restricted Cubic Splines Across All Available Diastolic Parameters

Age-, sex-, and BMI-adjusted spline fits for Peak $\dot{V}O_2$ and $\dot{V}E/\dot{V}CO_2$ slope

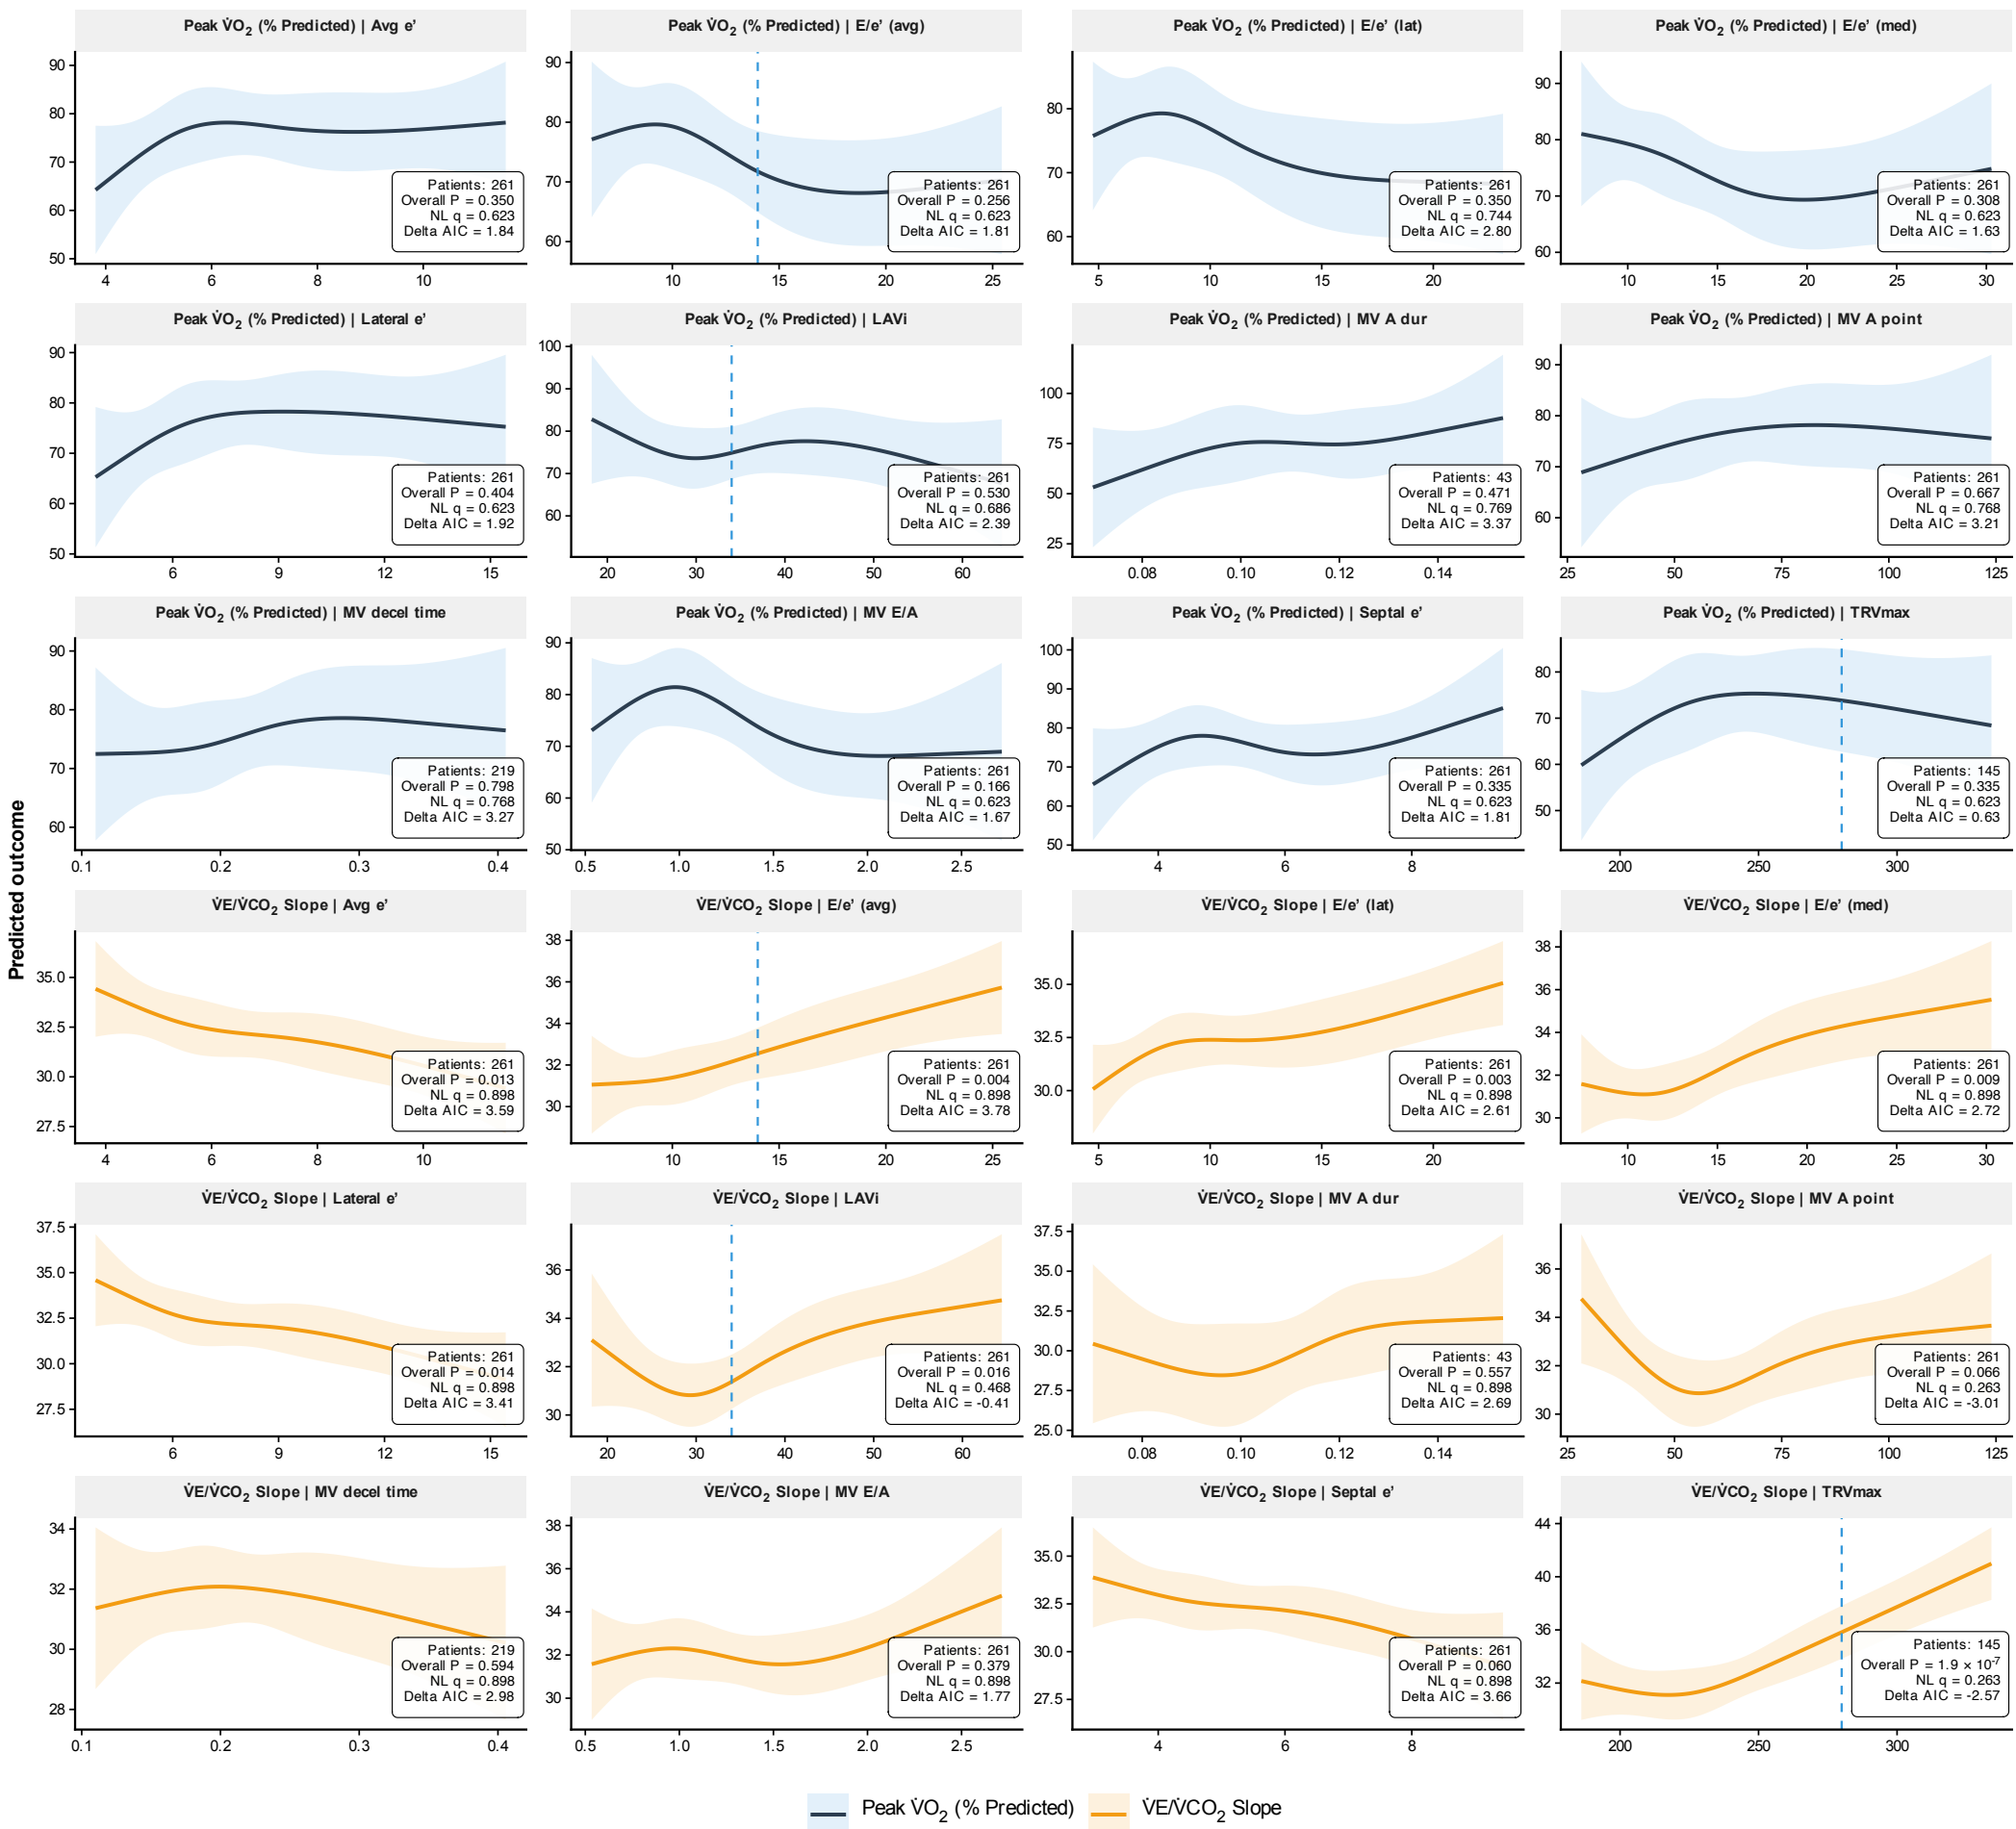

Figure S1. Supplemental restricted cubic spline models relating all available diastolic parameters to Peak $\dot{V}O_2$ and $\dot{V}E/\dot{V}CO_2$ slope. Each panel shows age-, sex-, and BMI-adjusted spline-estimated associations with shaded 95% confidence intervals. Dashed blue vertical lines indicate ASE reference cutoffs where available. Annotation boxes report patient count, overall association P value, nonlinearity FDR q-value (BH-adjusted within each outcome across all 12 diastolic indices), and Δ AIC (spline vs. linear model).
