

(A)

**Peak VO<sub>2</sub> OMARX Model**

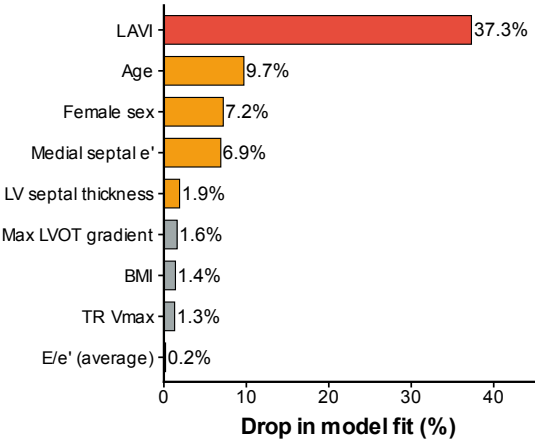

BMI-adjusted MARS, n = 142; no retained primary diastolic knot

(B)

**VE/VCO<sub>2</sub> OMARX Model**

BMI-adjusted MARS, n = 142; LAVI dominated the model and retained a knot near ASE 34

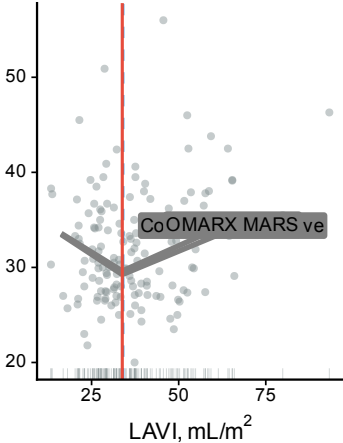

(C)

**LAVI Partial Effect for VE/VCO<sub>2</sub>**

OMARX knot = 33.8 mL/m<sup>2</sup>; ASE = 34.0

Predicted VE/VCO<sub>2</sub> slope

(D)

**LAVI Threshold Robustness**

Bootstrap LAVI retention frequency = 59.5%
