

Figure S2. Publication-format summary of the revised OMARX analysis. **(A)** Variable-importance profile for the BMI-adjusted OMARX MARS model of Peak VO₂, showing dominant contributions from age and BMI and no retained primary diastolic knot. **(B)** Variable-importance profile for the corresponding VE/VCO₂ model, highlighting LAVI as the dominant predictor with supplementary contributions from age, sex, medial septal e', and septal thickness. **(C)** OMARX partial-effect plot for LAVI in the VE/VCO₂ model, with raw complete-case observations in the background, the primary retained OMARX knot shown as a solid red line, and the ASE reference value of 34 mL/m² shown as a dashed blue line. **(D)** Sensitivity analyses for the VE/VCO₂ LAVI threshold across alternative model specifications.
